

[프로젝트 세부주제]

- → WEB을 이용한 LED 제어
- → WEB을 이용한 DHT11 온도,습도 모니터링

박매일

1. 사전준비사항

준비물

- Arduino(WeMos D1)
- DHT11 Sensor
- 브래드보드
- LED 1개
- 저항 1개(220 Ohm)
- 점퍼케이블
- 전원 케이블(USB)

디렉토리 만들기

C:₩MQTTProject

source

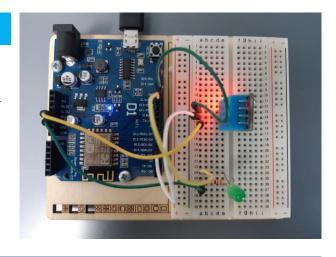

SW

설치 프로그램

- mosquitto
- Arduino IDE
- Node.js
- MongoDB

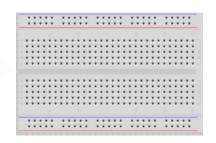

통신연결 주소

- WiFi AP 이름
- WiFi AP 비밀번호
- PC IP주소 (ipconfig)

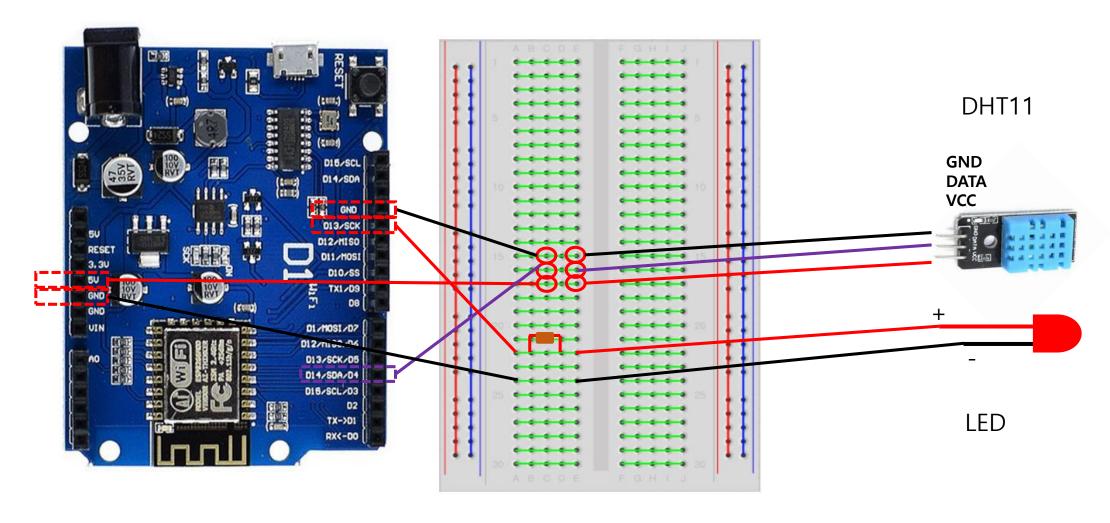

2. 회로도 구성

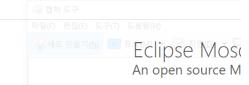

- 1. Eclipse Mosquitto™ An open source MQTT broker Download
 - → https://mosquitto.org/

Eclipse Mosquitto is an open source (EPL/EDL licensed) message broker that implements the MQ devices from low power single board computers to full servers.

The MQTT protocol provides a lightweight method of carrying out messaging using a publish/su sensors or mobile devices such as phones, embedded computers or microcontrollers.

The Mosquitto project also provides a C library for implementing MQTT clients, and the very pop

Mosquitto is part of the Eclipse Foundation, is an iot.eclipse.org project and is sponsored by ceda-

Download

Mosquitto is highly portable and available or binaries for your platform.

Test

You can have your own instance of for a wide range of platforms. Go to the Mosquitto running in minutes, but to make dedicated download page to find the course testing even easier, the Mosquitte Project runs a test server at test.mosquitto.org where you can test your clients in a variety of

Source

- mosquitto-1.6.6.tar.gz (319kB) (GPG signature)
- Git source code repository (github.com)

Older downloads are available at https://mosquitto.org/files/

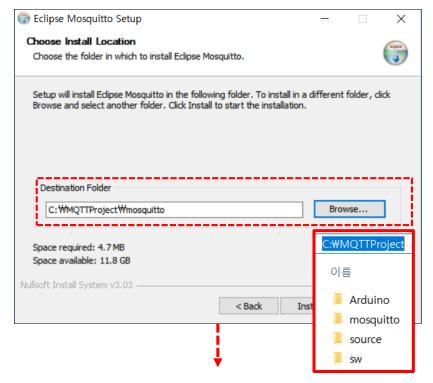

Binary Installation

The binary packages listed below are supported by the Mosquitto project. In ma

Windows

- mosquitto-1.6.6-install-windows-x64.exe (~1.4 MB) (64-bit build, Windows
- mosquitto-1.6.6-install-windows-x32.exe (~1.4 MB) (32-bit build, Windows

2. Mosquitto™ MQTT broker 설치 및 서버구동

mosquito server 구동 및 구독자, 발행자 실행

② subscriber(구독자) 실행→수신대기 창

C:₩MQTTProject₩mosquitto>**mosquitto_sub -t iot -p 1883** hello

{"tmp":25,"hum":70}

(외부에서 연결하는 방법)

C:₩MQTTProject₩mosquitto>mosquitto_sub -h MQTT서버ip주소 -t iot -p 1883

③ publisher(발행자) 실행→메시지(토픽) 발행 창

C:₩MQTTProject₩mosquitto>**mosquitto_pub –t iot –m "hello**"

C:₩MQTTProject₩mosquitto>mosquitto_pub -t iot -m "{\"tmp\":25,\"hum\":70}

① cmd(관리자 권한으로 실행)에서 서버 구동 > 서버 구동 창

C:₩MQTTProject₩mosquitto≯mosquitto –v

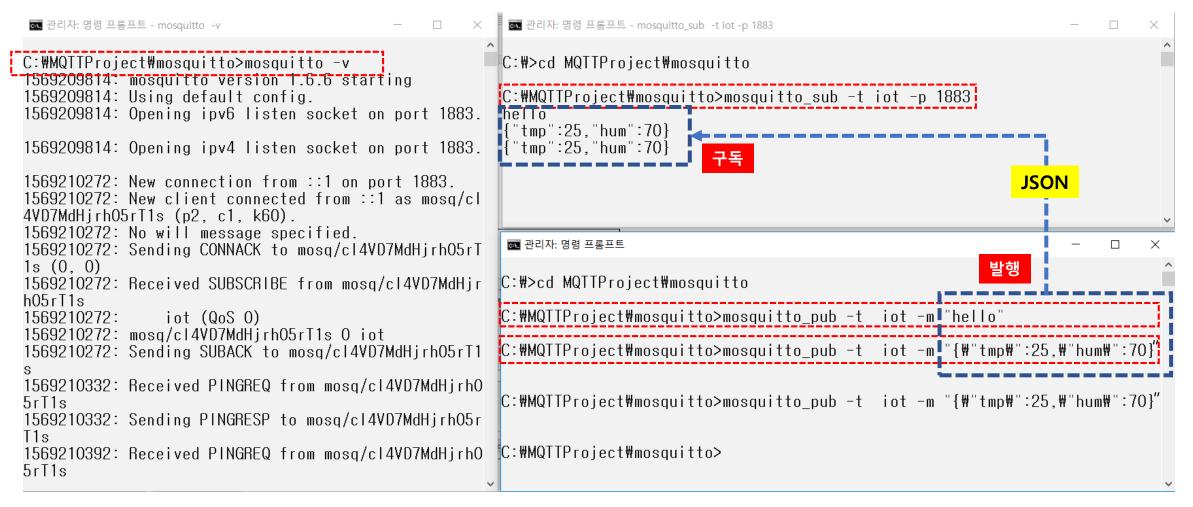

1569209814: mosquitto version 1.6.6 starting

1569209814: Using default config.

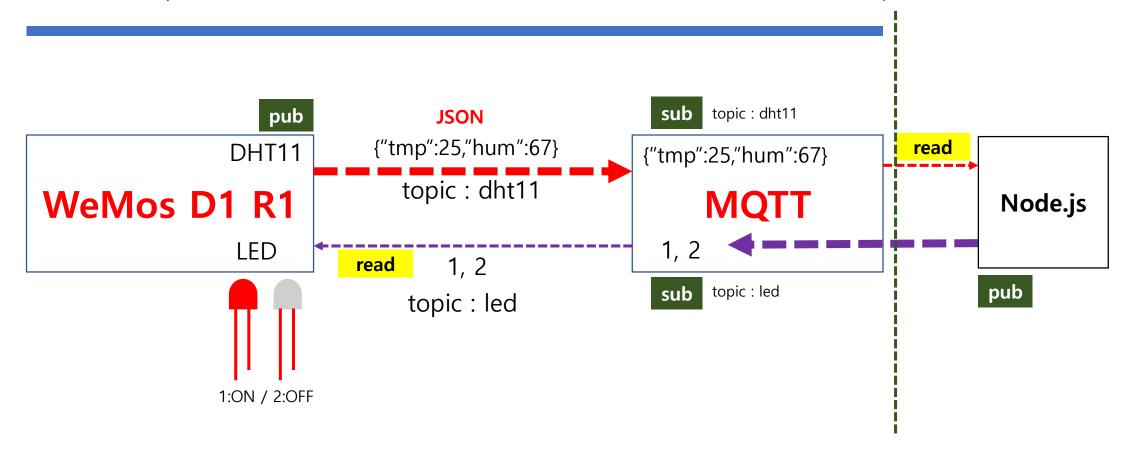

1569209814: Opening ipv6 listen socket on port 1883.

1569209814: Opening ipv4 listen socket on port 1883.

3. MQTT broker 메시지 중개 테스트

1. 구현내용(WeMos에서 DHT11 Sensor 데이터를 MQTT 서버로 발행하는 부분)

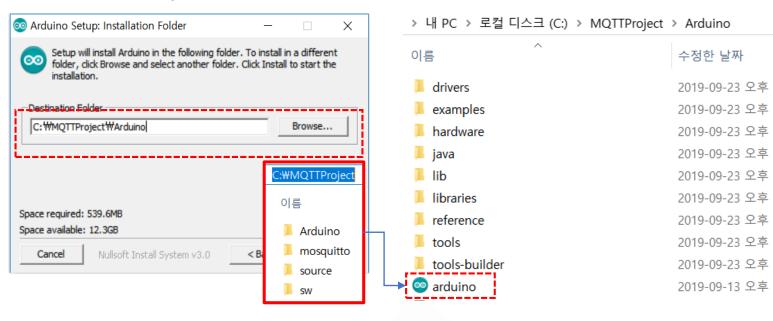

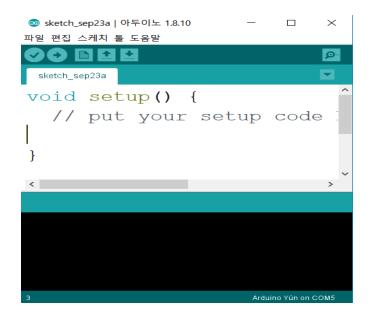

2. Download the Arduino IDE

→ http://arduino.cc

3. Arduino 설치

WeMos 보드의 장점

- 아두이노 UNO와 비슷
- 펌웨어 개발 없이 wifi를 다룰 수 있음
- 많은 사람들이 이용하는 ESP8266 모듈
- 가격이 저렴한 편

WeMos 핀맵(pin map)	D15	SCL	GPI05

5. 아두이노 WeMos 환경 셋팅

환경설정 참고 SITE

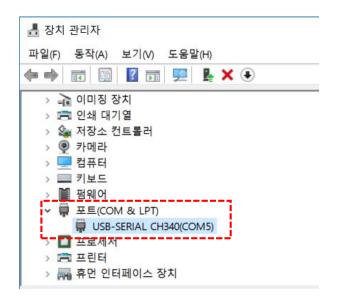

http://www.makewith.co/page/project/1004/story/2478/

STEP 1. WeMos를 컴퓨터에 연결하기

- 1. WeMos-D1 R1 보드를 usb케이블로 컴퓨터와 연결합니다.
- 2. Windows OS가 반응합니다. 새 하드웨어의 부착을 알리고 USB 드라이버를 설치합니다.
- 3. 시스템에서 드라이버를 찾지 못할 경우 USB 드라이버를 다운로드 해야합니다. USB 인터페이스 칩은 CH340G입니다.

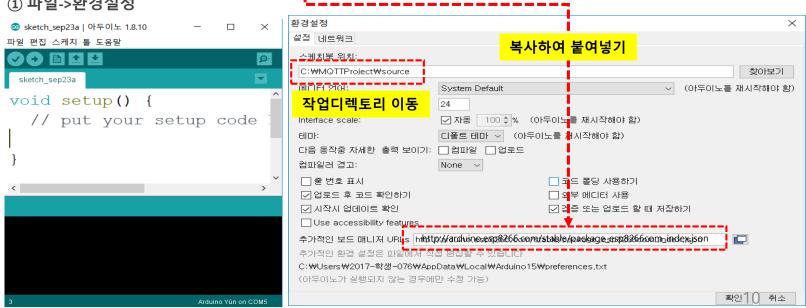

STEP 2. 연결 확인하기

장치관리자(Device Manager)에서 확인합니다.

STEP 3. 아두이노 IDE에 WeMos 보드 라이브러리 설치하기 →아래 URL을 클릭하지 말고 복사합니다.

http://arduino.esp8266.com/stable/package_esp8266com_index.json
① 파일->환경설정

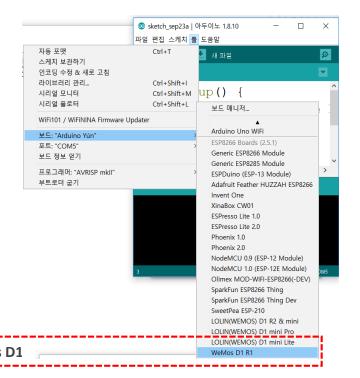

STEP 4. Board Manager로 WeMos보드 설치하기

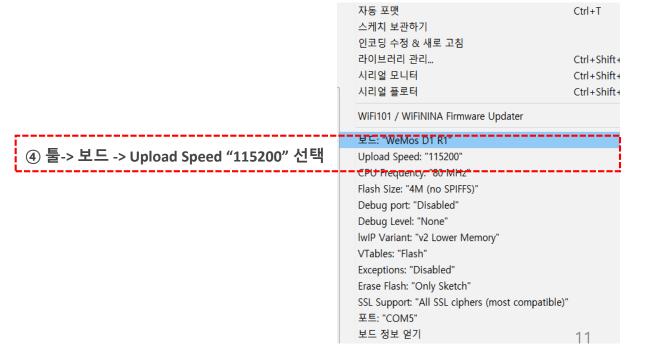

② 툴-> 보드 -> 보드 매니저...

- →"esp8266 of ESP8266 Community"를 검색해서 설치해 주세요.
- → 설치 후 아두이노 IDE를 껐다 켜주세요.

STEP 5. WeMos 보드 선택하기 & speed 설정하기

7. PubSubClient 라이브러리 설치

ESP8266 모듈에 MQTT 기능을 구현하기 위해서는 해당 라이브러리가 필요합니다. 아두이노 개발환경에서 사용할 수 있도록 개발된 라이 브러리가 여러 종류가 있는데 여기서는 **PubSubClient** 라이브러리를 사용하도록 하겠습니다. 일단 아두이노 개발환경을 실행하고 아래 순서대로 라이브러리를 설치하면 됩니다.

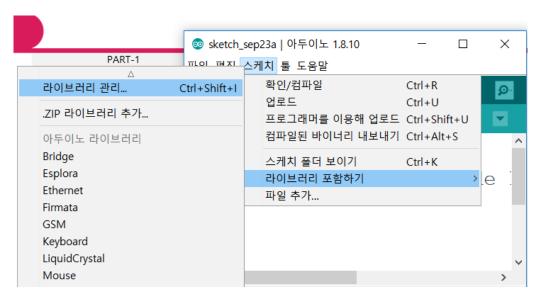

C:#MQTTProject#source#libraries

이름

DHTlibrary

PubSubClient

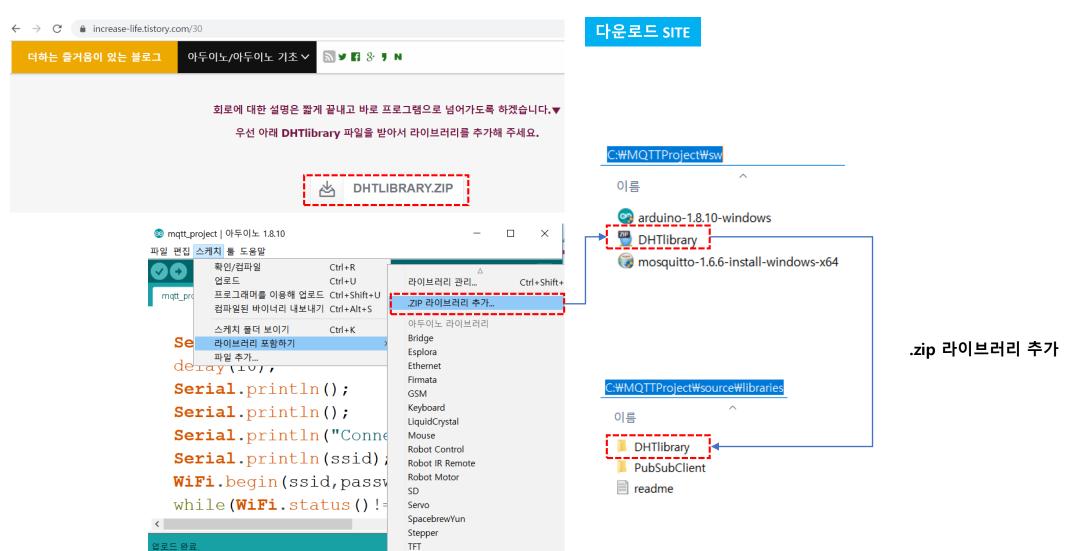

- ① 스케치 → 라이브러리 포함하기 --> 라이브러리 관리
- ② PubSubClient 검색
- ③ 클릭 후 최신 버전 설치

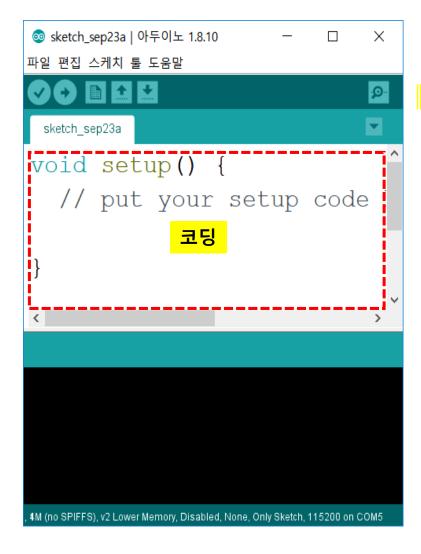

닫기

8. DHT11 라이브러리 설치

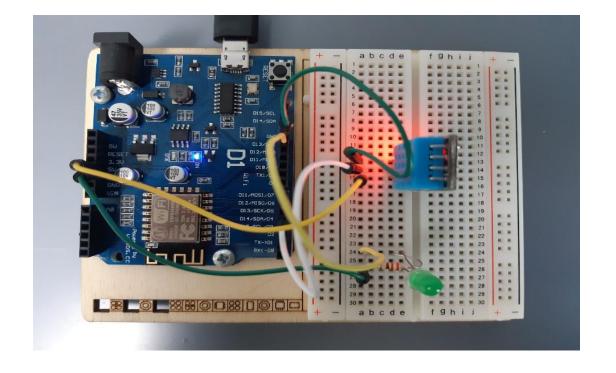

Temboo WiFi

9. 소스코딩(소스저장)

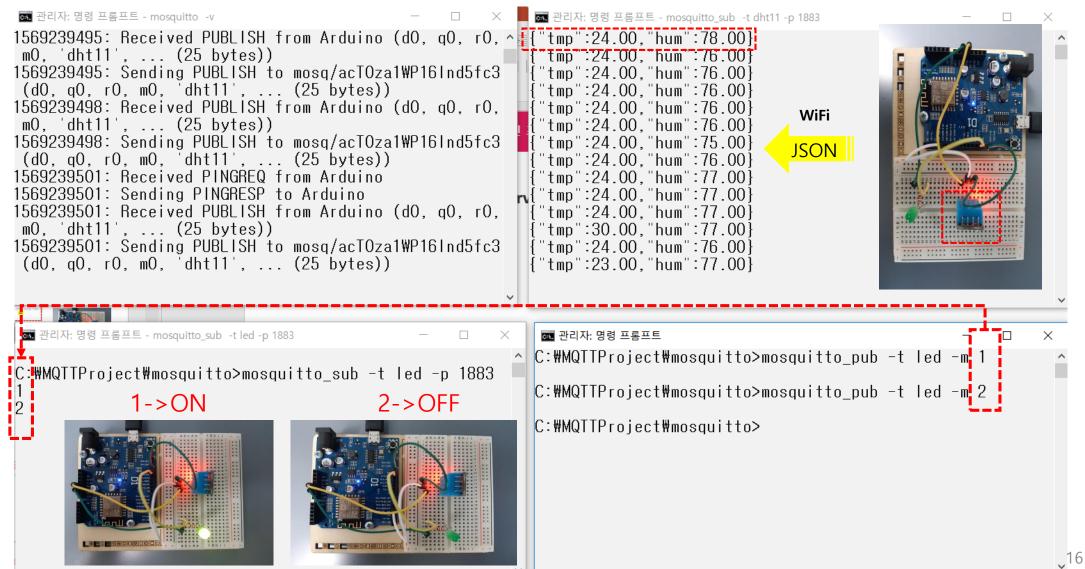

```
10. 소스코드(mqtt_project.ino)
            char ssid[]="WiFi AP이름";
